

1. A liquid crystal display apparatus, comprising:

a second substrate arranged opposite the first substrate;

a plurality of pixels which are sandwiched between said first substrate and said second substrate and form a display section,

2. The liquid crystal display apparatus according to claim 1, wherein said first and second pixel electrodes can provide each of said pixels with a corresponding potential.

a first signal driver for supplying a potential to said first pixel electrodes;

a signal control circuit for controlling signals transmitted to said first and second signal

4. The liquid crystal display apparatus according to claim 1, wherein said first pixel electrode, said common electrodes, and said second pixel electrodes are disposed on said first substrate.

wherein said first pixel electrode and said common electrode are linear and are arranged substantially in parallel, and

6. The liquid crystal display apparatus according to claim 4,

wherein in each pixel, said first pixel electrode and said common electrode are linear and are arranged substantially in parallel, and

at least part of said second pixel electrode overlaps said first pixel electrode or said common electrode.

7. The liquid crystal display apparatus according to claim 6,

wherein said second pixel electrode is linear, and

said second pixel electrode is as wide as or narrower than the first pixel electrode or common electrode, which is overlapped by the part of the

8. The liquid crystal display apparatus according to claim 6,

said second pixel electrode is wider than
said first pixel electrodes or common electrode, which
is overlapped by the part of the second pixel
electrode.

wherein said first pixel electrode and said common electrode are linear and are arranged substantially in parallel, and

10. The liquid crystal display apparatus according to claim 4,

said common electrode is located between said first pixel electrode and said second pixel electrode.

wherein plural pieces of said first pixel electrode arranged for said corresponding pixels are connected together via a first junction, plural pieces of said second pixel electrode arranged for said corresponding pixels are connected together via a second junction, and said plural pieces of said first pixel electrode and said first junction do not overlap

19. The liquid crystal display apparatus according to claim 5,

20. The liquid crystal display apparatus according to claim 6,

21. The liquid crystal display apparatus according to claim 10,

wherein when the difference between the potentials provided to said first pixel electrode and to said common electrode is largest or smallest, the potential provided to said second pixel electrode is

substantially equal to the potential provided to said first pixel electrode.

22. The liquid crystal display apparatus according to claim 16,

wherein when a difference between the potentials provided to said first pixel electrode and to said second pixel electrode is largest or smallest, the potential provided to said common electrode is substantially equal to an average of the potentials provided to said first pixel electrode and to said second pixel electrode.

23. The liquid crystal display apparatus according to claim 1,

wherein said liquid crystal layer has a positive dielectric anisotropy.

24. The liquid crystal display apparatus according to claim 1, further comprising:

a scan driver;

a plurality of first scan lines connected to the scan driver;

a plurality of first signal lines connected to said first signal driver and disposed so as to cross said plurality of first scan lines; and

second signal lines connected to said second signal driver, and

wherein said plurality of pixels each correspond to an area enclosed by a corresponding one of said plurality of first scan lines and a corresponding

neighborhood of an intersection between said corresponding first scan line and said first signal line; and

second switch elements each arranged in a neighborhood of an intersection between said corresponding first scan line and said second signal line.

27. A liquid crystal display apparatus comprising:

a first substrate;

a second substrate arranged opposite said first substrate;

a liquid crystal layer sandwiched between said first substrate and said second substrate; and

a plurality of pixels which are sandwiched between said first substrate and said second substrate and form a display section,

wherein each of said pixels has a first and a second pixel electrodes each corresponding to said pixel and disposed on said first substrate, and a common electrode corresponding to said first and said second pixel elements and disposed on either said first or said second substrate.
